

ENVIRONMENTAL COMMITMENT

Alghero Airport plays a decisive role in the economic and social development of the territory in which it is located, where the naturalistic heritage represents one of the most important strengths of the tourism sector. Environmental sustainability is therefore one of the main objectives of SOGEAL S.p.A, as the activity determines a significant impact in terms of exploitation of natural resources, polluting emissions and noise. The commitment to achieve a sustainable development model is summarized in the SOGEAAL S.p.A. adherence to the principles of the Sustainable Development Goals defined by the United Nations in 2015 in order to promote on a global scale an economic development compatible with the protection and conservation of the environment, sensitive to social aspects such as the fight against poverty, the protection of safety and health of people.

The airport's activity has a significant impact on the following environmental factors:

1. Water supply;
2. Waste water;
3. Energy requirement;
4. Waste production and management;
5. Atmosphere Emissions;
6. Noise.

In the continuous effort to improve efficiency and reduce the use of primary resources, SOGEAAL S.p.A. has already implemented over the last few years technical and management measures that have started a process of minimizing the environmental impact. The further step is the preparation of the first 2021 Sustainability Report and the adhesion to the program Airport Carbon Accreditation (ACA) Level 1 - mapping, in 2022, intended to give precise, transparent reporting according to international standards of environmental footprint and the measures necessary for its gradual reduction. In order to achieve this ambitious goal, SOGEAAL S.p.A. specifically intends:

- Measure and monitor in a capillary way the water and energy needs to offer the services related to them according to the regulatory and quality standards, minimizing the purchase or withdrawal of primary resources and using renewable sources as much as possible;
- Reduce energy consumption by using higher efficiency technologies and management measures (LED lighting, inverter motors, automation for climate control and lights);
- Optimize and increase the efficiency of wastewater treatment for the purpose of wastewater reuse;
- Raise awareness and direct all subjects operating at the airport to share sustainability objectives;
- Launch a management system for the collection and delivery of waste to favor its differentiation and recycling;
- Plan, implement and continuously verify the objectives and actions aimed at minimizing environmental impacts, in the context of the development of the airport and its activities.

The Company intends to communicate and share the environmental strategy at all levels so that each employee and any other interested party can cooperate in its application.

The CEO
Alberto Perini
